Key Ratio Types and Their Calculations (Sohail Afzal Approach)

Sohail Afzal's Advanced Accounting likely covers a wide range of financial ratios. Let's examine some of the most important categories and examples, highlighting the approach typically presented in the text:

Profitability Ratios:

- **Gross Profit Margin:** $(\text{Gross Profit} / \text{Revenue}) \times 100$. This ratio measures the profitability of a company's core operations after deducting the cost of goods sold. A higher margin indicates greater efficiency in managing costs. Sohail Afzal might present various examples across different industries to highlight the varying norms for acceptable gross profit margins.
- **Net Profit Margin:** $(\text{Net Profit} / \text{Revenue}) \times 100$. This ratio reveals the percentage of revenue remaining as profit after all expenses, including taxes and interest, are deducted. It's a crucial indicator of overall profitability and the efficiency of the entire business operation. The solutions provided by Sohail Afzal often emphasize the importance of comparing this ratio across time periods or to industry benchmarks.
- **Return on Assets (ROA):** $(\text{Net Profit} / \text{Total Assets})$. This ratio measures how effectively a company utilizes its assets to generate profit. A higher ROA suggests better asset management. Sohail Afzal likely details how to analyze ROA in conjunction with other profitability metrics for a holistic view.

- **Return on Equity (ROE):** $(\text{Net Profit} / \text{Shareholders' Equity})$. This indicates the return generated on the investment made by shareholders. It is a key measure for evaluating the performance from the perspective of the owners.

Liquidity Ratios:

- **Current Ratio:** $(\text{Current Assets} / \text{Current Liabilities})$. This assesses a company's ability to meet its short-term obligations using its current assets. A ratio above 1 generally indicates sufficient liquidity. Sohail Afzal's approach likely provides examples demonstrating how a current ratio below 1 might signal financial distress.
- **Quick Ratio (Acid-Test Ratio):** $(\text{Current Assets} - \text{Inventory}) / \text{Current Liabilities}$. This is a more conservative measure of liquidity, excluding inventory, which may not be easily converted to cash.

Solvency Ratios:

- **Debt-to-Equity Ratio:** $(\text{Total Debt} / \text{Shareholders' Equity})$. This shows the proportion of financing obtained through debt compared to equity. A high ratio indicates higher financial risk. Sohail Afzal likely emphasizes interpreting this ratio in context with the industry and the company's capital structure strategy.
- **Times Interest Earned:** $(\text{EBIT} / \text{Interest Expense})$. This assesses a company's ability to meet its interest obligations. A higher ratio indicates greater financial security.

Efficiency Ratios:

- **Inventory Turnover:** $(\text{Cost of Goods Sold} / \text{Average Inventory})$. This measures how efficiently a company manages its inventory. A higher turnover suggests efficient inventory management and less risk of

obsolescence. Sohail Afzal's explanation likely emphasizes the importance of considering industry-specific norms when interpreting this ratio.

- **Days Sales Outstanding (DSO):** $(\text{Average Accounts Receivable} / (\text{Annual Credit Sales}/365))$. This measures the average time it takes to collect payment from customers. A lower DSO indicates efficient credit and collection practices.
