FAQ

Q1: How often should I calibrate my NARCO AT50?

A1: Calibration frequency depends on usage and environmental conditions. The official NARCO AT50 manual will provide specific recommendations, but typically, calibration is recommended before each use, at least monthly, or after any potential impact or exposure to harsh conditions. A bump test (exposing the sensor to a known concentration to ensure it's still working) should be performed more frequently – daily in some work environments.

Q2: What type of batteries

does the NARCO AT50 use?

A2: The specific battery type used in the NARCO AT50 will be specified in the device's manual. It commonly uses standard, readily available batteries; however, always refer to the manufacturer's documentation for exact specifications to ensure the correct battery type is used. Using incompatible batteries can damage the device.

Q3: What should I do if the NARCO AT50 alarm sounds?

A3: Immediately evacuate the area and follow your established emergency procedures. Identify the source of the CO leak and take appropriate remedial actions, such as ventilating the space or shutting down equipment. Do not attempt to operate the equipment in the presence of high CO levels.

Q4: Can I use the NARCO AT50 to detect other gases?

A4: No. The NARCO AT50 is

specifically designed to detect carbon monoxide (CO). Using it to detect other gases will result in inaccurate readings and could lead to dangerous situations. You'd need a multi-gas detector for other gases.

Q5: How long does the sensor last in the NARCO AT50?

A5: The sensor lifespan varies depending on usage and environmental conditions. Refer to the official NARCO AT50 manual for the manufacturer's recommended replacement schedule. Regular bump tests help assess sensor performance.

Q6: Where can I find replacement parts for my NARCO AT50?

A6: Contact the manufacturer directly or an authorized dealer for replacement parts. Using non-approved parts can void the warranty and compromise the device's performance and safety.

Q7: What is the difference between a bump test and a calibration?

A7: A bump test verifies that the sensor is functioning correctly, whereas calibration ensures the accuracy of the readings by adjusting the sensor's response to a known concentration of CO. Bump testing is more frequent, while calibration is usually less frequent, depending on operational needs.

Q8: What does AT50 analyzer maintenance entail?

A8: This covers regular checks of the battery, sensor functionality via bump tests, proper cleaning of the sensor and housing, and adherence to the manufacturer's recommended calibration schedule. It also includes careful storage of the device when not in use to prolong its lifespan.
